

UNOX Movie Booking Database

LEVEL 1: Data Retrieval & Filtering Basics

Scenario 1: Movie Listing Dashboard

Business Context:

The operations team wants to view basic details about movies currently available in the system.

Problem Statements:

1. Retrieve all movie details from the database.
 2. Show only the movie title, genre, and rating.
 3. Display the same results but with user-friendly column names using aliases.
-

Scenario 2: Screen Management

Business Context:

The cinema manager wants to check available screens by type.

Problem Statements:

1. Retrieve all screen details.
2. Display only the screen name and capacity.
3. Retrieve screens with a capacity greater than 150.

Scenario 3: User Directory

Business Context:

The admin team wants to view customer contact details.

Problem Statements:

1. Retrieve all user names and their email addresses.
2. Use column aliases to make the output more readable.
3. List users who have provided a phone number.

LEVEL 2: Advanced Filtering & Logical Operators

Scenario 1: Targeted Movie Search

Business Context:

The marketing team wants to identify movies to promote based on their attributes.

Problem Statements:

1. Find all movies whose titles start with the letter 'A'.
2. Retrieve all movies that belong to either the 'Action' or 'Comedy' genre.
3. Retrieve movies with ratings between 7.5 and 9.0.

Scenario 2: Show Scheduling Check

Business Context:

The scheduling team wants to verify upcoming shows and avoid scheduling errors.

Problem Statements:

1. Retrieve all shows scheduled after a specific date.
2. Find shows that are **not** assigned to Screen 1 or Screen 2.
3. Identify shows that have not yet been assigned a movie.

Scenario 3: User Reward Analysis

Business Context:

The membership team wants to analyze user points and participation.

Problem Statements:

1. Retrieve users who have between 100 and 500 reward points.
 2. Identify users who have zero points or have not been linked to a user record.
 3. Retrieve members who have earned points and have a valid email address.
-

LEVEL 3: Aggregation & Ordering

Scenario 1: Movie Ratings Summary

Business Context:

The analytics team wants to understand how different genres are performing.

Problem Statements:

1. Count the number of movies available in each genre.
2. Find the average rating for each genre.
3. Display the genres in order of their average rating (highest first).

Scenario 2: Ticket Sales Insights

Business Context:

The finance team wants to track booking and revenue patterns.

Problem Statements:

1. Count how many bookings each user has made.
2. Calculate total booking revenue per show.
3. List shows in descending order of total revenue.

Scenario 3: Food Sales Reporting

Business Context:

The food & beverage team wants to know which food items are selling best.

Problem Statements:

1. Find how many times each food item was ordered.
2. Calculate the total sales amount for each food item.
3. List food items in descending order of total sales.
