

Activity 12

GDP Per Capita Calculation

Problem statement: Compute GDP per person for each country-year to normalize economic size by population.

KNIME implementation (what to do)

- Read GDP_Population_Enriched.
- Use Expression to compute $\text{gdp_per_capita} = \text{gdp_value} / \text{population_value}$, guard for zero/NULL.
- Use GroupBy if you want country- or region-level averages over time.
- Output as GDP_Per_Capita_Table.

Explanation / purpose

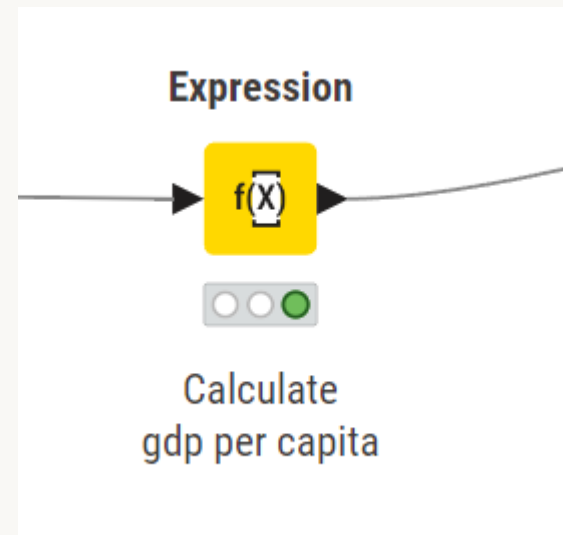

Standardizes GDP for comparability; essential for per-person welfare comparisons and plotting income distribution across countries.

Visual / KNIME suggestion

Line charts per country, scatterplot vs electricity access or unemployment.

Activity 12

GDP Per Capita Calculation

Activity 13

GDP Per Capita Visual Gallery

Problem statement: Visualize GDP per capita trends and comparisons across countries/regions and relate to other KPIs.

KNIME implementation (what to do)

Read GDP_Per_Capita_Table.

Prepare views:

- Bar Chart for selected country over time.
- Create interactive dashboards.

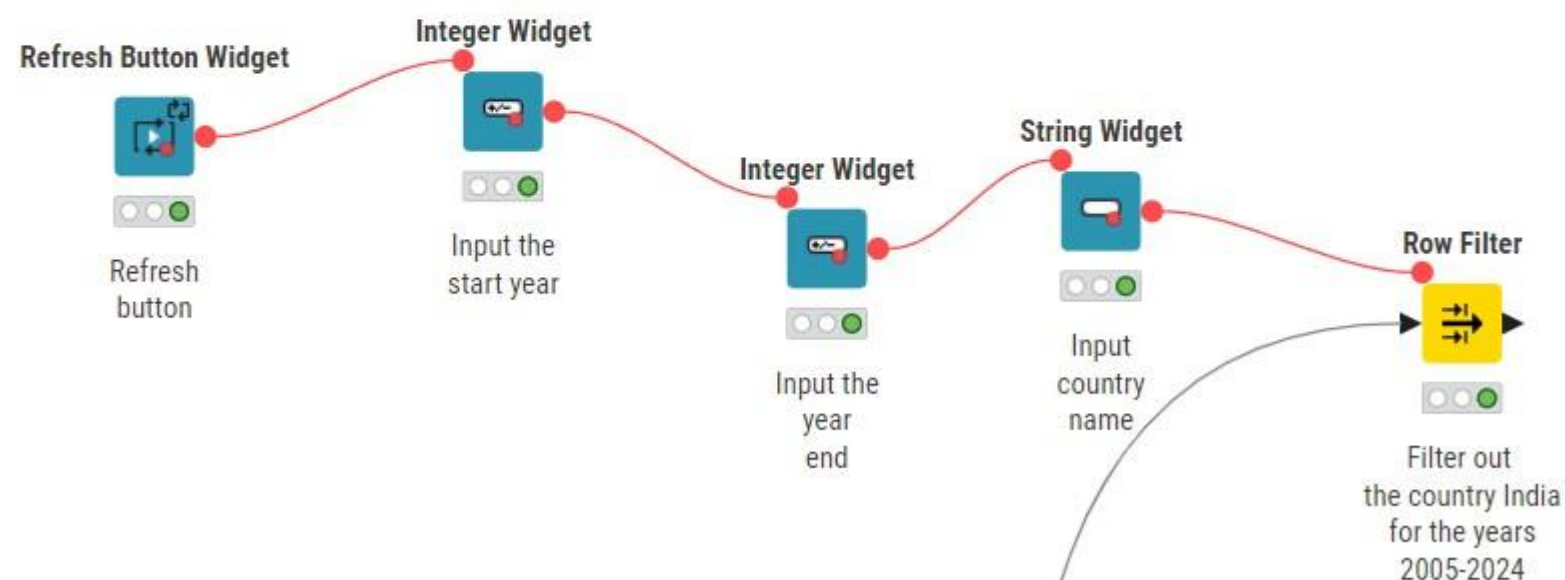

Explanation / purpose: Provides the core per-capita economic story; enables cross-indicator exploration and ranking.

Visual / KNIME suggestion: create a dashboard page with input (country, year range).
